

PAWS a Risc-V RV32IMCB CPU – Programming Guide

About

PAWS is a project to occupy my time in retirement (and as it happened the Covid-19 lockdowns), with the aim of teaching myself about FPGA programming. It is based upon the idea of the 8-bit computers and consoles from the 1980s, but using a modern CPU.

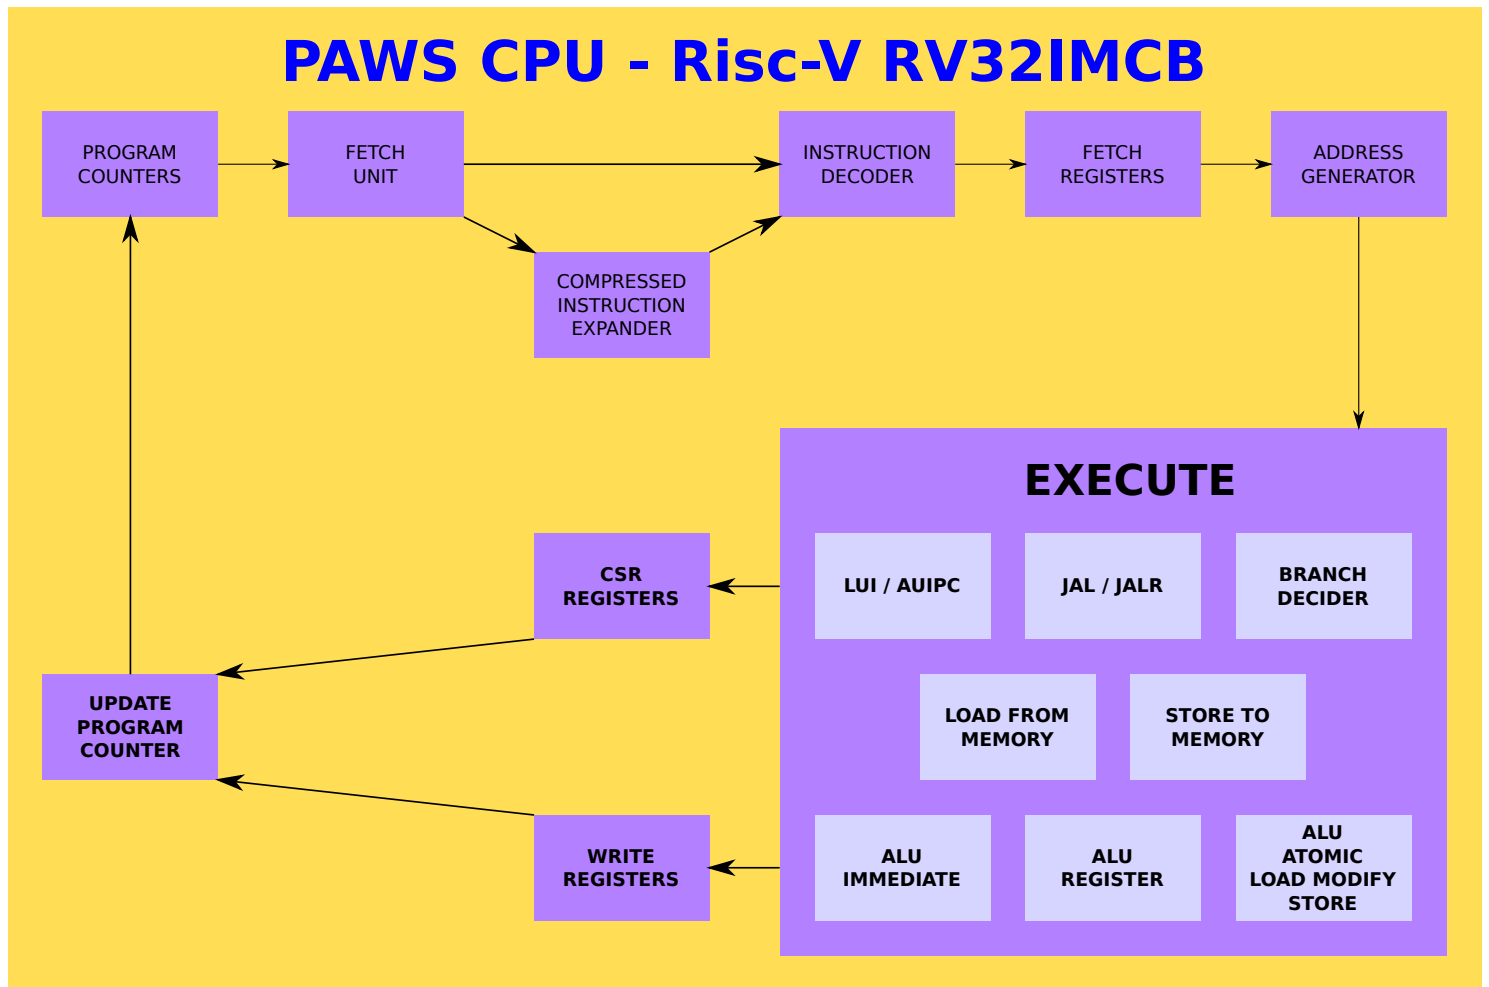

A support library, libPAWS, for easy access to the hardware is provided, along with a few sample C programs to test the hardware and the programming library. This documentation details libPAWS and describes the hardware.

Silice

PAWS is coded in Silice, a hardware description language developed by @sylefeb. Details can be found here [GitHub](https://github.com/sylefeb/Silice) (<https://github.com/sylefeb/Silice>).

My coding style may not result in the *best* design, the aim was to create a design that could be easily understood.

PAWS CPU and SOC

The PAWS CPU is a Risc-V RV32IMCB that implements only the features needed to run GCC or LLVM/CLANG compiled code.

- No interrupts.
- Machine mode only.

The PAWS CPU has two modes:

- Single thread using all available cycles.
- Dual thread
 - Execute an instruction from each thread alternatively.
 - Second thread can be stopped/started as required.

SDRAM Cache

The SDRAM has a 32k directly mapped cache. A directly mapped cache was used to simplify the cache logic.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Memory access are organised as 16 bit, the bus width of the SDRAM chip on the ULX3S. 16-bit compressed instructions are preferred as due to latency during instruction fetching these will be fetched, decoded and executed quicker than 32-bit instructions.

The bit manipulation extension was implemented to increase code density, as when output by the compiler they will replace multiple RV32I instructions, again leading to quicker code execution due to reduced memory access. Presently maintained to draft 0.93, which is compatible with LLVM 12.0.0.

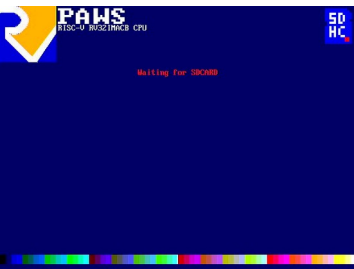

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Using PAWS

	 <p>PAWS RISC-V RV32IMCB CPU SD HC Waiting For SDCARD</p>	 <p>PAWS RISC-V RV32IMCB CPU SD HC SDCARD Ready</p>	 <p>PAWS RISC-V RV32IMCB CPU SD HC Select PAW File SELECT USING FIRE 1 - SCROLL USING FIRE 2 Current PAW File: 3DMAZE</p>
 <p>PAWS RISC-V RV32IMCB CPU SD HC PAW File SELECTED Current PAW File: 3DMAZE</p>	 <p>PAWS RISC-V RV32IMCB CPU SD HC PAW File LOADING Current PAW File: 3DMAZE</p>	 <p>PAWS RISC-V RV32IMCB CPU SD HC FILE LOADED LAUNCHING Current PAW File: 3DMAZE</p>	
BIOS PAW File Selected	BIOS PAW File Loading	BIOS PAW File Loaded	

The PAWS system starts in the BIOS, which initialises the system, and provides a file explorer for the PAW (compiled programs) files in the ROOT DIRECTORY of PARTITION 0 on a FAT16 formatted SDCARD.

To run a PAW file, scroll through the available files using “LEFT” and “RIGHT”, then select a file for loading and executing using “FIRE 1”. The selected file will be loaded into SDRAM and launched.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Compiling Programs For PAWS

The default language for PAWS is C, specifically GCC, with support for LLVM and CLANG.

To create a program for PAWS, create a C file in the SOFTWARE/c directory. It is advised to use the SOFTWARE/template.c as a starting point.

Contents of template.c	Explanation
<pre>#include "PAWSlibrary.h" void main(void) { INITIALISEMEMORY(); while(1) { } }</pre>	<p>Use libPAWS for definitions and helper functions.</p> <p>MAIN program loop Setup the memory map</p> <p>Main loop.</p>

Compile your code using the shell scripts. For example, to compile the included asteroids style arcade game, `./compile.sh c/asteroids.c PAWS/ASTROIDS.PAW` or `./clang.sh c/asteroids.c PAWS/ASTROIDS.PAW`. Either will compile the program to PAWS/ASTROIDS.PAW, which can be copied to the SDCARD for loading via the BIOS.

PAWS uses newlib to provide a C library, and libgcc to provide software floating-point arithmetic. The shell scripts will link to these libraries installed in their default locations on ArchLinux.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Colours

PAWS uses a 6-bit colour attribute, given as RRGGBB. This gives 64 colours, specified in hexadecimal as per the table below. Names defined in libPAWS are shown.

BLACK	0x01	DKBLUE	BLUE	0x04	0x05	0x06	LTBLUE
DKGREEN	0x09	0x0a	0x0b	GREEN	0x0d	0x0e	CYAN
0x10	DKPURPLE	0x12	PURPLE	0x14	GREY1	0x16	LTPURPLE
0x18	0x19	0x1a	0x1b	0x1c	LTGREEN	0x1e	LTCYAN
DKRED	0x21	DKMAGENTA	0x23	BROWN	0x25	0x26	0x27
DKYELLOW	0x29	GREY2	0x2b	0x2c	0x2d	0x2e	0x2f
RED	0x31	0x32	MAGENTA	0x33	LTRED	0x36	LTMAGENTA
ORANGE	LTORANGE	PEACH	PINK	YELLOW	LYELLOW	0x3e	WHITE

Colour Test

Display Structure

The display in PAWS is organised in layers. The arrangement of the layers can be adjusted, with the background layer always being at the bottom.

The default arrangement of layers (top to bottom) is:

- Character (Text) Layer
- Upper Sprite Layer
- Bitmap Layer
- Lower Sprite Layer
- Upper Tile Map Layer
- Lower Tile Map Layer
- Background Layer

PAWS Asteroids, showing the background (dark blue and falling stars), the bitmap (logo, galaxy image, “GAME OVER” and the fuel bars), the tile maps (the small planets and rocket ships), the sprites (asteroids, UFO, player ship), and the character map (player score and instructions).

PAWS Asteroids runs in screen mode 2, where the bitmap is displayed below the sprites and the tile maps.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

libPAWS Variables and Functions

<code>void await_vblank(void)</code>	Waits for the screen vertical blank to start.
<code>void screen_mode(unsigned char screenmode)</code>	Changes the display layer order. 0 = default, as above. 1 = bitmap between lower sprites and the tilemaps. 2 = bitmap between the tilemaps and the background. 3 = bitmap between the upper sprites and the character map.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Memory Management

The BIOS will initialise the memory, and allocates space at the top of fast BRAM memory for the CPU STACK, and space at the top the SDRAM for SDCARD buffers.

Address Range	Memory Type	Usage
0x00000000 - 0x00008000	Fast BRAM	0x0000 - 0x1000 BIOS 0x8000 - 0x4000 Main Stack 0x4000 - 0x2000 SMT Stack 0x1000 - 0x1400 printf buffer 0x1400 - 0x2000 fast storage
0x00008000 - 0x0000ffff	I/O Registers	Commuincation with the PAWS hardware. No direct hardware access is required, as libPAWS provides functions for all aspects of the PAWS hardware.
0x1000000 - 0x1fffffff 0x1000000 - 0x10800000 0x10800000 -	SDRAM PROGRAM + LOADED DATA MALLOC ALLOCATED MEMORY	Program and data storage. Accessed via a cache. SDCARD buffers and structures are allocated at the top of this address range.

libPAWS variables and functions

unsigned char *MEMORYTOP	Points to the top of unallocated memory.
void INITIALISEMEMORY(void)	Sets up the memory map using parameters passed from the BIOS. Allocates the buffers used for SDCARD access and initialises malloc.
unsigned char *filemalloc(unsigned int size)	Allocates space for a file to be read into memory. Preferred over malloc so as to allow for clusters from the SDCARD to be read into.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

File Management

libPAWS has the ability to load files from the SDCARD directly into memory.

libPAWS variables and functions

<code>unsigned short sdcard_findfilename(unsigned char *filename, unsigned char *ext)</code>	Returns the number of the file in the root directory on the SDCARD, or 0xffff if the file is not found.
<code>unsigned int sdcard_findfilesize(unsigned short filename)</code>	Returns the size of the file, in bytes.
<code>void sdcard_readfile(unsigned short filename, unsigned char * copyAddress)</code>	Reads the file into memory.

Example code for loading a file (GALAXY.JPG) into memory
<pre>#include "PAWSlibrary.h" void main(void) { INITIALISEMEMORY(); unsigned char *galaxyfilebuffer; unsigned short filename; while(1) { outputstring("Finding File GALAXY.JPG"); filename = sdcard_findfilename("GALAXY", "JPG"); if(filename == 0xffff) { outputstring("FILE NOT FOUND"); } else { galaxyfilebuffer = filemalloc(sdcard_findfilesize(filename)); sdcard_readfile(filename, galaxybuffer); } (void)inputcharacter(); } }</pre>

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Single Thread or Dual Thread Mode

On startup PAWS runs in single thread mode. The BIOS will switch back to single thread mode when returning to the BIOS from a program running in dual thread mode.

Whilst dual thread mode is activated PAWS will execute one instruction from each thread alternatively. All memory is shared, with no memory protection.

The Risc-V A Extension (Atomic Instructions) are decoded and executed, but ignoring the *aq* and *rl* flags. The whole of the fetch-modify-write cycle will complete before allowing the other thread to execute. FENCE instructions from the Risc-V base are treated as no-ops.

libPAWS variables and functions

<code>void SMTSTOP(void)</code>	<code>void SMTSTART(unsigned int code)</code>	Stops the SMT thread.
<code>void SMTSTART(unsigned int code)</code>		Starts the SMT thread, jumping immediately to the address of the function provided.

Due to the way that all of the I/O operations are memory mapped there are considerations to make when writing dual threaded code. Some suggestions for best practice are listed below:

- Only one thread should access the GPU, tile-maps, character map or audio. If both threads attempt to they could be overwriting the control registers leading to an unknown outcome.
- The sprite layers control registers are memory mapped to allow both threads to control the sprites.

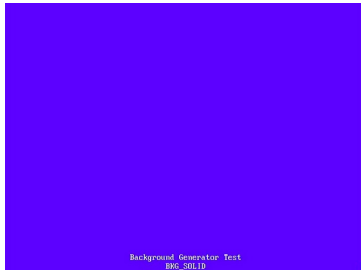

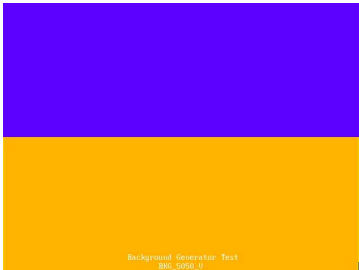

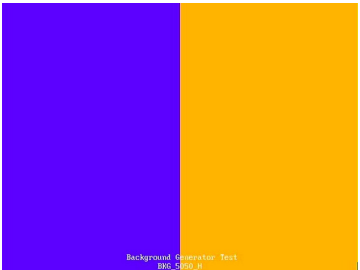

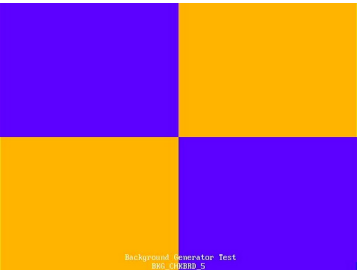

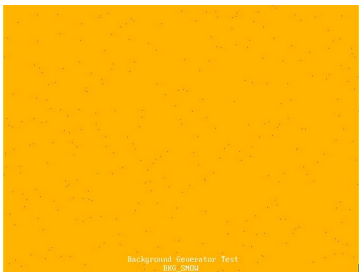

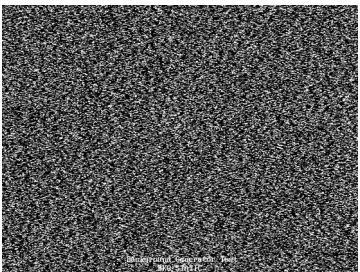

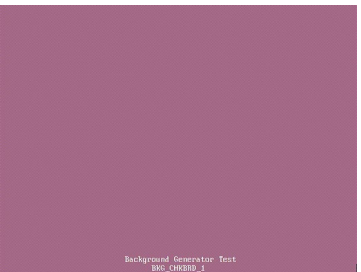

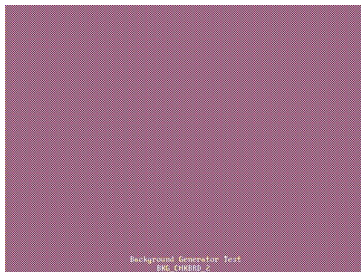

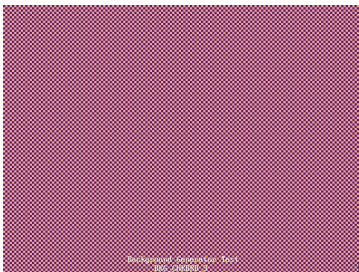

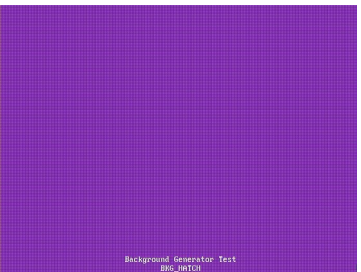

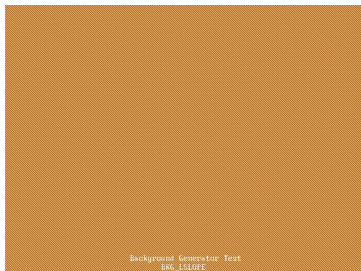

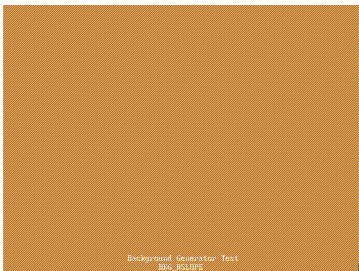

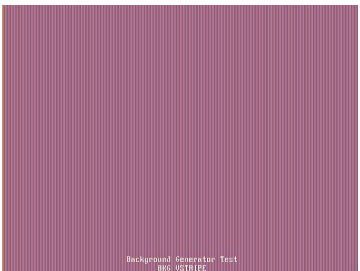

Example code for a simple dual thread program
<pre>#include "PAWSlibrary.h" void smtthread(void) { // SETUP STACKPOINTER FOR THE SMT THREAD asm volatile ("li sp ,0x4000"); while(1) { gpu_rectangle(rng(64), rng(640), rng(432), rng(640), rng(432)); sleep(500, 1); } } void main(void) { INITIALISEMEMORY(); tpu_printf_centre(27, TRANSPARENT, GREEN, "SMT Test"); tpu_printf_centre(28, TRANSPARENT, YELLOW, "I'm Just Sitting Here Doing Nothing"); tpu_printf_centre(29, TRANSPARENT, BLUE, "The SMT Thread Is Drawing Rectangles!"); SMTSTART((unsigned int)smtthread); while(1) { tpu_set(1, 1, TRANSPARENT, WHITE); tpu_printf("Main Thread Counting Away: %d", systemclock()); sleep(1000, 0); } }</pre>

NOTE: The first line of code in the smtthread function **must** set the stack pointer to the reserved memory in the fast BRAM.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Background Generator

The background layer shows when there is nothing to display from the layers above. There are 16 named generators in libPAWS. The result of the individual background generators are shown in the table below.

Result of set_background(PURPLE, ORANGE, <i>value from table</i>);			
 Background Generator Test BKG_SOLID	 Background Generator Test BKG_5050_V	 Background Generator Test BKG_5050_H	 Background Generator Test BKG_CHKBRD_5
 Background Generator Test BKG_RAINBOW	 Background Generator Test BKG_SNOW	 Background Generator Test BKG_STATIC	 Background Generator Test BKG_CHKBRD_1
 Background Generator Test BKG_CHKBRD_2	 Background Generator Test BKG_CHKBRD_3	 Background Generator Test BKG_CHKBRD_4	 Background Generator Test BKG_HATCH
 Background Generator Test BKG_LSLOPE	 Background Generator Test BKG_RSLOPE	 Background Generator Test BKG_VSTRIPE	 Background Generator Test BKG_HSTRIPE

In addition, a simple co-processor, called COPPER, is available to change background generator parameters.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Background COPPER Programming

The COPPER is designed to allow the changing of the background generator parameters during the display frame. The COPPER program storage has 64 entries, there is one variable, and it can detect the present X and Y coordinates (range X = 0 to 639, Y = 0 to 479).

COMMAND	CONDITION	VALUE	MODE	ALT	COLOUR / ADDRESS	
JUMP	ALWAYS				ADDRESS	Jump to ADDRESS
JUMP	IF_NOT_VBLANK				ADDRESS	Jump to ADDRESS if NOT VBLANK
JUMP	IF_VBLANK				ADDRESS	Jump to ADDRESS if VBLANK
JUMP	IF_NOT_ACTIVE				ADDRESS	Jump to ADDRESS if OFF SCREEN
JUMP	IF_Y_LESS	Y COORDINATE			ADDRESS	Jump to ADDRESS if Y is LESS THAN VALUE
JUMP	IF_X_LESS	X COORDINATE			ADDRESS	Jump to ADDRESS if X is LESS THAN VALUE
JUMP	IF_VARIABLE_LESS	VALUE			ADDRESS	Jump to ADDRESS if VARIABLE is LESS THAN VALUE
WAIT_VBLANK	SET FLAGS		MODE	ALT	COLOUR	Wait for VBLANK and SET
WAIT_HBLANK	SET FLAGS		MODE	ALT	COLOUR	Wait for HBLANK and SET
WAIT_Y	SET FLAGS	Y COORDINATE	MODE	ALT	COLOUR	Wait for Y and SET
WAIT_X	SET FLAGS	X COORDINATE	MODE	ALT	COLOUR	Wait for X and SET
WAIT_VARIABLE	SET FLAGS	X/Y FLAG	MODE	ALT	COLOUR	Wait for VARIABLE to be EQUAL to X or Y
SET_VARIABLE	1	VALUE				Set VARIABLE to VALUE
ADD_VARIABLE	2	VALUE				Add VALUE to VARIABLE
SUB_VARIABLE	4	VALUE				Subtract VALUE from VARIABLE
SET_FROM_VARIABLE	SET_FLAGS					SET from VARIABLE

A simple COPPER program that sets the background generator to the BKG_SNOW pattern on a BLACK background, and changes the colour of the snow/stars every 64 pixels down the screen to give a rainbow effect.

```
copper_startstop( 0 );
copper_program( 0, COPPER_WAIT_Y, 7, 0, BKG_SNOW, BLACK, WHITE );
copper_program( 1, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, WHITE );
copper_program( 2, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 64, 0, 0, 1 );
copper_program( 3, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, RED );
copper_program( 4, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 128, 0, 0, 3 );
copper_program( 5, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, ORANGE );
copper_program( 6, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 160, 0, 0, 5 );
copper_program( 7, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, YELLOW );
copper_program( 8, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 192, 0, 0, 7 );
copper_program( 9, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, GREEN );
copper_program( 10, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 224, 0, 0, 9 );
copper_program( 11, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, LTBLUE );
copper_program( 12, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 256, 0, 0, 11 );
copper_program( 13, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, PURPLE );
copper_program( 14, COPPER_JUMP, COPPER_JUMP_IF_Y_LESS, 288, 0, 0, 13 );
copper_program( 15, COPPER_WAIT_X, 7, 0, BKG_SNOW, BLACK, MAGENTA );
copper_program( 16, COPPER_JUMP, COPPER_JUMP_IF_NOT_VBLANK, 0, 0, 0, 15 );
copper_program( 17, COPPER_JUMP, COPPER_JUMP_ALWAYS, 0, 0, 0, 1 );
copper_startstop( 1 );
```

A simple COPPER program that sets the background generator to the BKG_SNOW pattern on a BLACK background, and cycles through the colours for the snow/stars every frame, giving a twinkling stars effect.

```
copper_startstop( 0 );
copper_program( 0, COPPER_VARIABLE, COPPER_SET_VARIABLE, 1, 0, 0, 0 );
copper_program( 1, COPPER_WAIT_Y, 6, 0, BKG_SNOW, BLACK, 0 );
copper_program( 2, COPPER_SET_FROM_VARIABLE, 1, 0, 0, 0, 0 );
copper_program( 3, COPPER_VARIABLE, COPPER_ADD_VARIABLE, 1, 0, 0, 0 );
copper_program( 4, COPPER_JUMP, COPPER_JUMP_IF_NOT_VBLANK, 0, 0, 0, 4 );
```

PAWS a Risc-V RV32IMCB CPU – Programming Guide

```
copper_program( 5, COPPER_JUMP, COPPER_JUMP_IF_VARIABLE_LESS, 64, 0, 0, 1 );  
copper_program( 6, COPPER_JUMP, COPPER_JUMP_ALWAYS, 0, 0, 0, 0 );  
copper_startstop( 1 );
```

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Bitmap and GPU

PAWS displays a 320x240 pixel bitmap with 64 colours, plus TRANSPARENT. To allow for tear-free animation, there are two bitmaps, and it is possible to display one, whilst drawing to the other. The default is to draw and display the same bitmap, numbered 0.

PAWS has a GPU to draw to the bitmap. The functions in libPAWS will setup the GPU, wait for the previous GPU command to complete, and then start the GPU with the required function.

libPAWS variables and functions

<code>void bitmap_display(unsigned char framebuffer)</code>	Display bitmap 0 or 1.
<code>void bitmap_draw(unsigned char framebuffer)</code>	Draw to bitmap 0 or 1.
<code>void gpu_cs(void)</code>	Clears the bitmap to TRANSPARENT and resets the scroll/wrap.
<code>void gpu_dither(unsigned char mode, unsigned char colour)</code>	Sets the dither mode and the alternate colour used for filled rectangles, circles and triangles.
<code>void gpu_pixel(unsigned char colour, short x, short y)</code>	Plots a pixel at (x,y) in colour.
<code>void gpu_line(unsigned char colour, short x1, short y1, short x2, short y2)</code>	Draws a line from (x1,y1) to (x2,y2) in colour.
<code>void gpu_box(unsigned char colour, short x1, short y1, short x2, short y2)</code>	Draws an outline rectangle with corners at (x1,y1) and (x2,y2) in colour. NOTE: Drawn by breaking into 4 lines.
<code>void gpu_rectangle(unsigned char colour, short x1, short y1, short x2, short y2)</code>	Draws a filled rectangle with corners at (x1,y1) and (x2,y2) in colour. Uses the dither mode.
<code>void gpu_circle(unsigned char colour, short x1, short y1, short radius, unsigned char filled)</code>	Draws a circle at centre (x1,y1) of the given radius in colour, optionally filled. Uses the dither mode when filling.
<code>void gpu_blit(unsigned char colour, short x1, short y1, short tile, unsigned char blit_size)</code>	Blit a 16x16 tile (32 user definable tiles) to (x1,y1) in colour. Will size to 16x16, 32x32, 64x64 and 128x128.
<code>void gpu_character_blit(unsigned char colour, short x1, short y1, unsigned char tile, unsigned char blit_size)</code>	Blit an 8x8 character (256 user definable characters, defaults to the IBM character set) to (x1,y1) in colour. Will size to 8x8, 16x16, 32x32, 64x64.
<code>void gpu_colourblit(short x1, short y1, short tile, unsigned char blit_size)</code>	Blit a 16x16 tile (32 user definable tiles) to (x1,y1). Will size to 16x16, 32x32, 64x64 and 128x128.
<code>void gpu_triangle(unsigned char colour, short x1, short y1, short x2, short y2, short x3, short y3)</code>	Draws a filled triangle with vertices (x1,y1), (x2,y2) and (x3,y3) in colour. Uses the dither mode. NOTE: Vertices should be presented clockwise from the top.
<code>void gpu_quadrilateral(unsigned char colour, short x1, short y1, short x2, short y2, short x3, short y3, short x4, short y4)</code>	Draws a filled quadrilateral with vertices (x1,y1), (x2,y2), (x3,y3) and (x4,y4) in colour. Uses the dither mode. NOTE: Drawn by breaking into two triangles, so vertices should be presented clockwise from the top.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

<code>void gpu_printf(unsigned char colour, short x, short y, unsigned char size, const char *fmt,...)</code>	Outputs a string (maximum 80 characters) by repeatedly using the character blitter, starting at (x,y) in colour. Will size the characters and space accordingly. NOTE: Escape characters are not processed, the corresponding character code is output as a character.
<code>void gpu_printf_centre(unsigned char colour, short x, short y, unsigned char size, const char *fmt, ...)</code>	Outputs a string by repeatedly using the character blitter, with the top centred at (x,y) in colour. Will size the characters and space accordingly. NOTE: Escape characters are not processed, the corresponding character code is output as a character.
<code>void set_blitter_bitmap(unsigned char tile, unsigned short *bitmap)</code>	Define one of the 32 16x16 blitter tiles.
<code>void set_blitter_chbitmap(unsigned char tile, unsigned char *bitmap)</code>	Define one of the 256 8x8 character blitter tiles.
<code>void set_colourblitter_bitmap(unsigned char tile, unsigned char *bitmap)</code>	Define one of the 32 16x16 colour blitter tiles.
<code>void draw_vector_block(unsigned char block, unsigned char colour, short xc, short yc)</code>	Starts the drawing of one of the 32 user definable vector (line drawn) objects, centred at (x,y) in colour.
<code>void set_vector_vertex(unsigned char block, unsigned char vertex, unsigned char active, char deltax, char deltay)</code>	Sets one of the 16 vertices in one of the 32 user definable vector (line drawn) objects.
<code>void bitmap_scrollwrap(unsigned char action)</code>	action == 1 LEFT, == 2 UP, == 3 RIGHT, == 4 DOWN, == 5 RESET

Example code for a tear-free animation	
<pre> #include "PAWSlibrary.h" void main(void) { // CURRENT FRAMEBUFFER unsigned short framebuffer = 0; INITIALISEMEMORY(); while(1) { // DRAW TO HIDDEN BITMAP bitmap_draw(!framebuffer); // CODE TO GENERATE THE BITMAP // DRAWN TO THE HIDDEN BITMAP // SWITCH THE FRAMEBUFFER await_vblank(); framebuffer = !framebuffer; bitmap_display(framebuffer); } } </pre>	

PAWS a Risc-V RV32IMCB CPU – Programming Guide

Dither Modes

When drawing rectangles, filled circles or filled triangles, the GPU can apply one of 16 “dither” patterns.

Result of `gpu_dither(dithermode, PURPLE);` Plus drawing a rectangle in ORANGE.

PAWS a Risc-V RV32IMCB CPU – Programming Guide

GPU Blitters

PAWS has 3 blitters:

- A single colour 16x16 tile blitter
 - TRANSPARENT pixels are ignored when drawing to the bitmap
- A single colour 8x8 tile blitter
 - Defaults to the IBM character set, used to draw text to the bitmap
- A colour 16x16 tile blitter
 - TRANSPARENT pixels are ignored when drawing to the bitmap

PAWS a Risc-V RV32IMCB CPU – Programming Guide

GPU Vector Blocks
